PLASMA PROTEIN THERAPIES
Uniquely Saving Lives

PPTA
Plasma Protein Therapeutics Association
About PPTA

The Plasma Protein Therapeutics Association is a 501(c)(6) non-profit trade association that represents plasma donation centers as well as plasma protein therapy manufacturers. Our mission is to promote the availability of and access to safe and effective plasma protein therapeutics for all patients in the world.

PPTA works to advocate for access to and affordability of therapies for patients, engage in constructive dialogue with regulatory agencies, and collaborate with patient advocacy organizations.

Plasma Protein Therapies: Uniquely Saving Lives

Treating Rare Diseases

Plasma is the straw-colored liquid portion of blood. It contains hundreds of proteins which carry out critical functions in the human body, such as antibodies to fight diseases and clotting factors to regulate bleeding. If a person has insufficient levels of any one plasma protein, his or her body cannot carry out these vital functions, causing a variety of chronic and life-threatening medical conditions.

Plasma protein therapies are unique biologic medicines that treat plasma protein deficiencies by replacing a person’s missing or functionally damaged proteins. In the United States, a disease is considered rare if it affects fewer than 200,000 individuals. Plasma protein deficiencies have very small patient populations and can be considered extremely rare.

Your blood is:

- **55%** Plasma
- **44%** Red Blood Cells
- **1%** White Blood Cells & Platelets

Your plasma is:

- **92%** Water
- **7%** Proteins
- **1%** Other Solutions

Proteins in your plasma:

- **Immunglobulins (Antibodies)**
- **Clotting Factors**
- **C1 Esterase Inhibitor**
- **Alpha-1 Proteinase Inhibitor**

Patients Treated with Plasma Protein Therapies in the U.S.

<tbody>
<tr>
<td><strong>Primary Immunodeficiency Diseases</strong></td>
<td></td>
</tr>
</tbody>
</table>
| - Caused by missing immunoglobulins (antibodies)  
  - Antibodies control the immune system and prevent illness  
  - Patients are chronically ill from severe, persistent, recurrent infections | 40,000 |
| **Chronic Inflammatory Demyelinating Polyneuropathy** |  |
| - Cause not certain; immune system attacks nerve coating  
  - Messages from the brain aren’t delivered to the body if nerve coating is damaged  
  - Patients experience progressive weakness, loss of limb function, and disability | 14,000 |
| **Bleeding Disorders (e.g. Hemophilia)** |  |
| - Caused by missing clotting factor protein  
  - Clotting factors control bleeding  
  - Patients cannot regulate bleeding  
  - Can be fatal if bleeding occurs in brain or vital organs | 30,000 |
| **Hereditary Angioedema** |  |
| - Caused by missing C1 esterase inhibitor protein (C1-INH)  
  - C1-INH helps regulate inflammation  
  - Patients have edema (severe swelling)  
  - Can be fatal if airway obstructed | 5,000 |
| **Alpha-1 Antitrypsin Deficiency** |  |
| - Caused by missing Alpha-1 Proteinase Inhibitor  
  - Alpha-1 Proteinase Inhibitor protects the lungs  
  - Patients have chronic emphysema and liver damage | 7,500 |

Made From Plasma

Donated Plasma Is A Finite Starting Material
The starting material for plasma protein therapies is not an infinite resource. Rather than using synthetic or chemical ingredients, plasma protein therapies are made using human plasma. **Plasma cannot be made in a laboratory.** Plasma and its life-saving proteins can only be obtained from donors who so generously give their time to donate.

Licensure
The Food & Drug Administration (FDA) approves medicines for safety & efficacy before they can be sold in the U.S. **Plasma protein therapies are the only medicines for which the starting material must also be licensed.** In addition to the final products, the FDA qualifies and approves plasma before it can be used for manufacturing.

Plasma Collection
Plasma is collected from healthy, compensated donors through a process called plasmapheresis. Plasmapheresis removes a donor’s plasma and returns the remaining blood components.

Plasma is collected at 780+ plasma donation centers in the U.S. After collection, the plasma donation is frozen and shipped to a state-of-the-art facility for manufacture into life-saving plasma protein therapies.

**EVERY YEAR IT TAKES APPROXIMATELY:**

- **130:** Plasma donations to treat one patient with a PRIMARY IMMUNODEFICIENCY DISEASE.
- **900:** Plasma donations to treat one patient with an ALPHA-1 ANTITRYPSIN DEFICIENCY.
- **1200:** Plasma donations to treat one patient with HEMOPHILIA.
Plasma protein therapies require constant vigilance for safe products. There are three types of safeguard measures used in plasma donation and manufacturing to ensure safe plasma protein therapies:

Voluntary industry standards often exceed regulatory requirements.

Current manufacturing protocols are extremely effective against pathogens.

The industry has a record of safety from pathogens for more than 20 years.

Evolving Protocols

Unlike traditional pharmaceuticals or other biologics where standard quality assurance practices are sufficient, plasma protein therapies’ safety protocols are constantly evolving due to new and emerging pathogens.

Companies must continuously perform tests to demonstrate that their viral inactivation and removal steps work on new pathogens. Most recently, companies invested significant time and resources into researching the Zika virus to ensure it does not threaten the safety of plasma protein therapies.
Complex Manufacturing

Plasma Protein Therapies are Highly Complex to Manufacture

Plasma protein therapies take **7-12 MONTHS** to manufacture. Companies must adhere to rigorous regulatory requirements to ensure manufacturing consistency and pathogen safety.

Value to Patients

As different policies to slow health spending are debated, it is critical to maintain access to life-saving treatments for rare disease patients. Although some value-based frameworks work for generic, interchangeable pharmaceuticals—a one-size-fits-all policy does not work for plasma protein therapies as these biologics are not interchangeable. Plasma protein therapies are high-impact pharmaceuticals because they increase life expectancy, improve quality of life, and reduce life-threatening complications for individuals with plasma protein deficiencies. Plasma protein therapies provide immeasurable, lifelong benefits to the patients who use them.

Plasma Protein Therapies: Uniquely Saving Lives

Value to Patients

10-year survival rate of patients with COMMON VARIABLE IMMUNE DEFICIENCY, by year

- 37% in 1971
- 78% in 1993
- 90% in 2008

Life expectancy of a patient born with HEMOPHILIA, by year

- 13 years in 1900
- 20 years in 1960
- 77 years in 2017

“Plasma-derived therapies saved my children’s lives, literally. The first thing that would happen if we didn’t have access to them would be that we would not be able to stop bleeding inside their bodies, they would first be in a lot of pain, then they would become crippled and eventually they would die.”
- Kerry, mother of sons with hemophilia

“To think about having to go back long term without my IVIG infusions, I would rather not be alive. I started to receive the plasma therapy and within a couple of months from being near death...I became very vital. These are life-saving therapies for which there is no alternative for many patients. To take away the plasma therapy from a PI patient such as myself---what you’re doing is condemning those people to a life of sickness and possibly death.”
- Terry, individual with a Primary Immunodeficiency Disease

VALUE TO THE SYSTEM The economic impact of diagnosing a Primary Immunodeficiency Disease and treating an individual with immunoglobulin therapy represents an average savings of $55,882 per year.

Non-Interchangeable & Unique

One-size-fits-all policies are unsuitable for plasma protein therapies and endanger patient health. Each therapy is unique due to the pharmacologic and manufacturing differences that exist across different brands and patients’ unique response to the treatments. Plasma protein therapies are non-interchangeable, sole-source biologics, therefore it is essential that patients have access to their medically justifiable therapy.

Expert Clinical Guidelines on Non-Interchangeability

“IVIG is not a generic drug and IVIG products are not interchangeable. A specific IVIG product needs to be matched to patient characteristics to insure patient safety.”

“Given the variable nature of these diseases, individualized treatments depending on patient need and physician judgment are important.”

“It is unacceptable to limit availability of augmentation therapy in any way and especially to a single product.”

“Because not all patients respond the same to each medication, it is the responsibility of the coordinating expert physician to work with each patient to define the optimal medication(s) for that particular patient.”

“It is critical that the bleeding disorder community has access to a diverse range of therapies and that prescriptions for specific clotting factor concentrates are respected and reimbursed.”

Employment
Each plasma donation center employs between 50 - 100 people.

Local Economies
On average, each plasma donation center puts $2 million into the community in donor compensation.

Strength in Numbers
There are more than 48 million plasma donations annually in the U.S.

Repeat Engagement
The average donor donates 21 times per year.
